Deploying ELK Stack on Docker Container Write up

Here our agenda is to deploy the ELK stack on the docker container to do that we have to follow the bellow steps. By following that we can obtain the output that we are trying to get.

First we have to create an instance in the EC2 of amazon AWS.

After that we have to create a docker and then elastic search in that docker.

And then give all the commands that are required to install all the important files and apps we need to deploy ELK on the docker container and the run it.

By doing this we can get the expected outcome which is deploying ELK stack on docker container.
